Title
Lack of Brute Force Protection Allows Account Compromise

Severity
High (7.3 CVSS score)

CVSS:3.1/AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:L/A:L

Affected endpoint

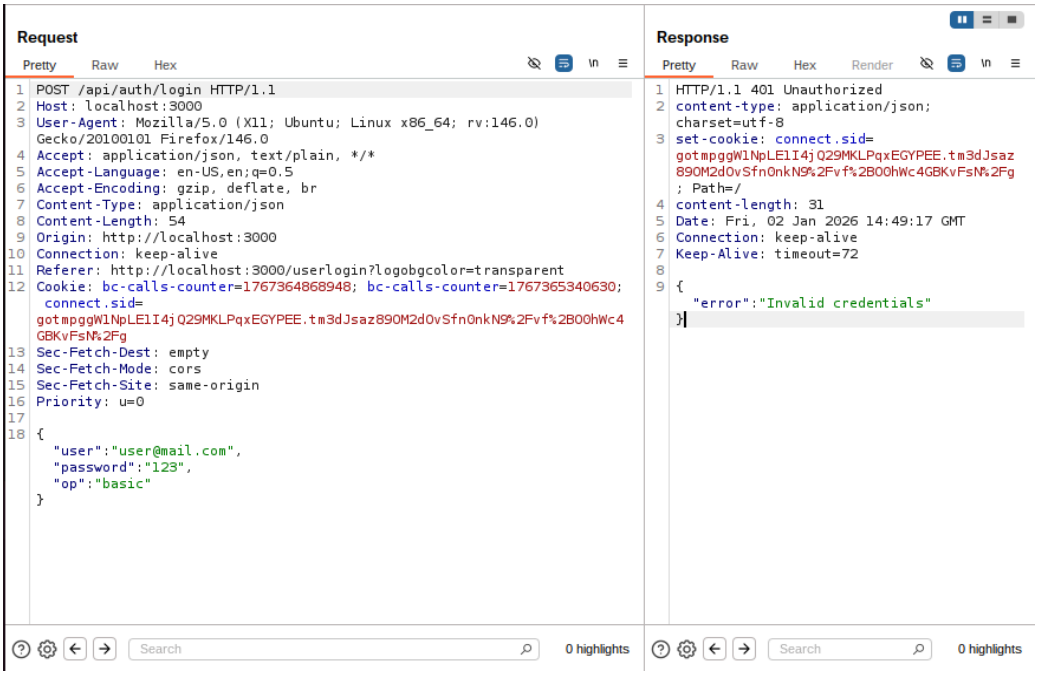
- POST **/userlogin**
- All authentication endpoints without rate limiting or account lockout

Vulnerability description
The application does not implement adequate protection mechanisms against brute force attacks on the authentication functionality. An attacker can repeatedly submit authentication attempts using automated tools without encountering any form of restriction, such as rate limiting, CAPTCHA, or account lockout.

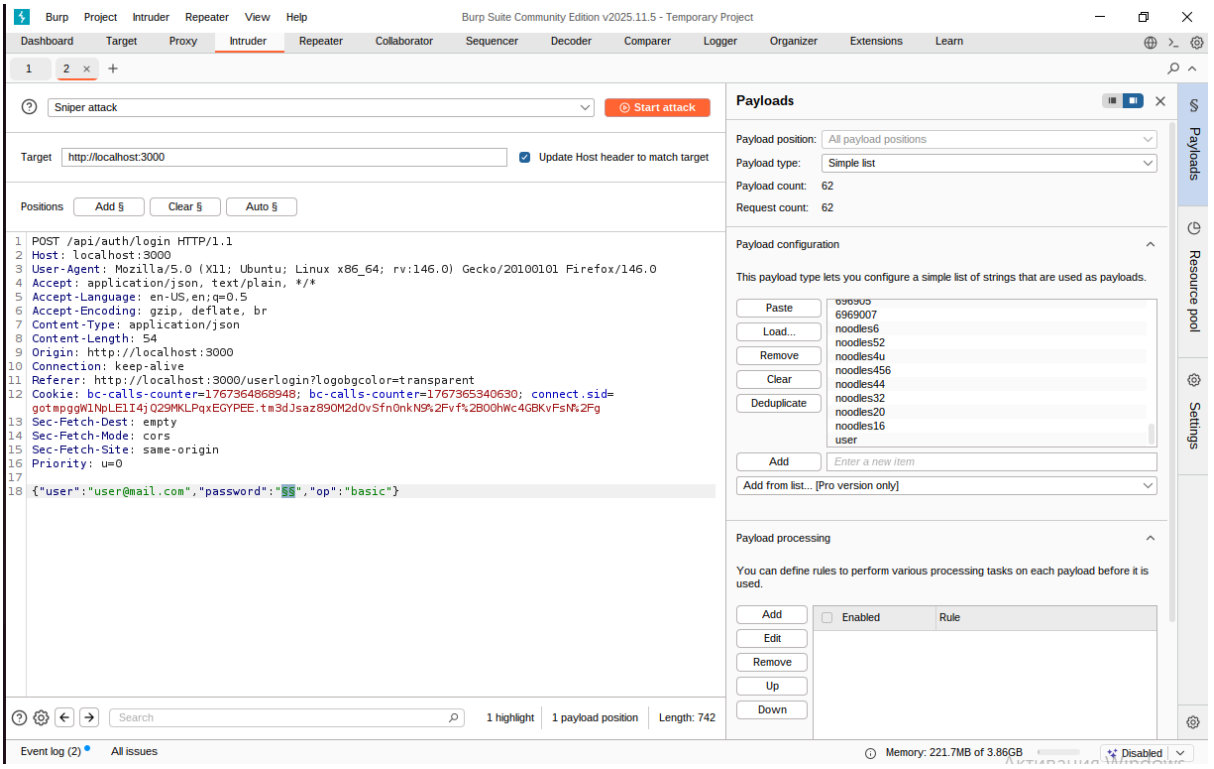
Additionally, the application returns distinguishable HTTP responses based on the correctness of the supplied password. When valid credentials are provided, the server responds with HTTP status code 201, allowing attackers to reliably identify successful authentication attempts and accelerate brute force attacks.

Proof of Concept

1. Log in using an existing user account identifier:
    - Email: user@mail.com
2. Intercept the login request using **Burp Suite Community Edition.**

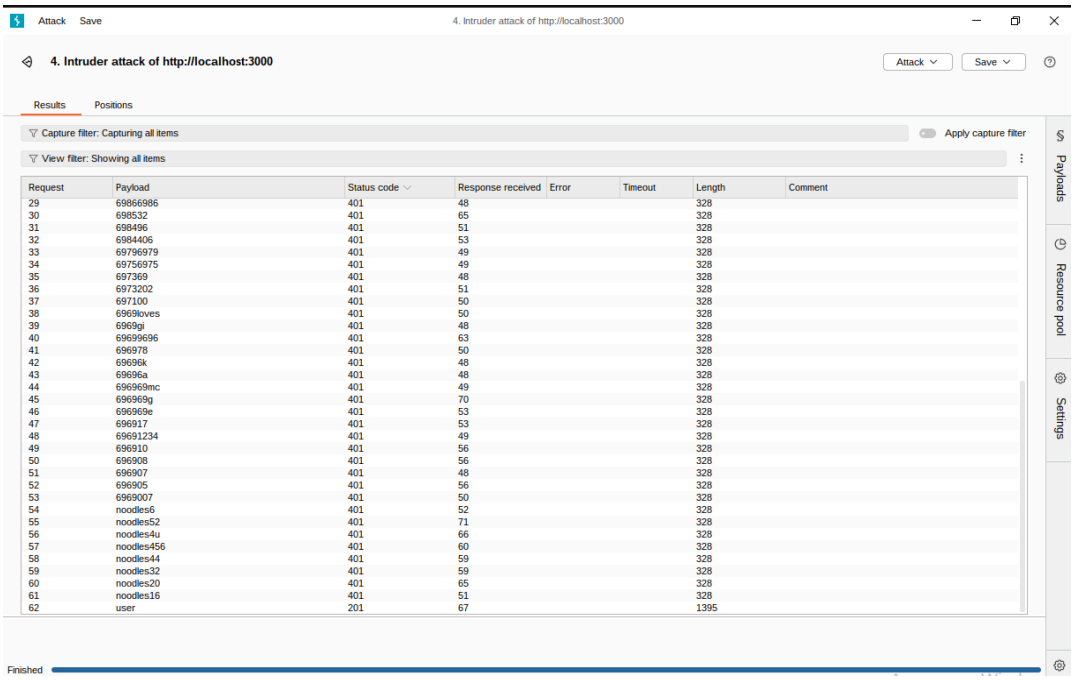


3. Send the request to **Intruder** and configure a brute force attack against the password parameter.



4. Start the attack using a password wordlist.
5. Observe the server responses:
   - Incorrect passwords return a different HTTP status code

- The correct password returns **HTTP 201**, clearly distinguishing successful authentication



Request	Payload	Status code	Response received	Error	Timeout	Length	Comment

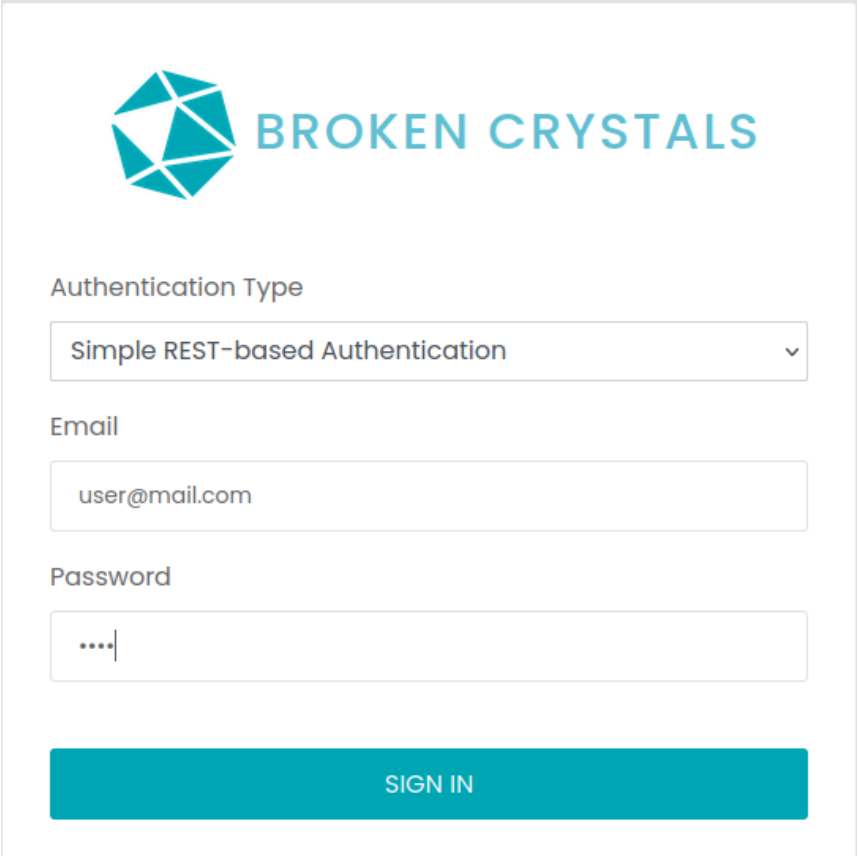
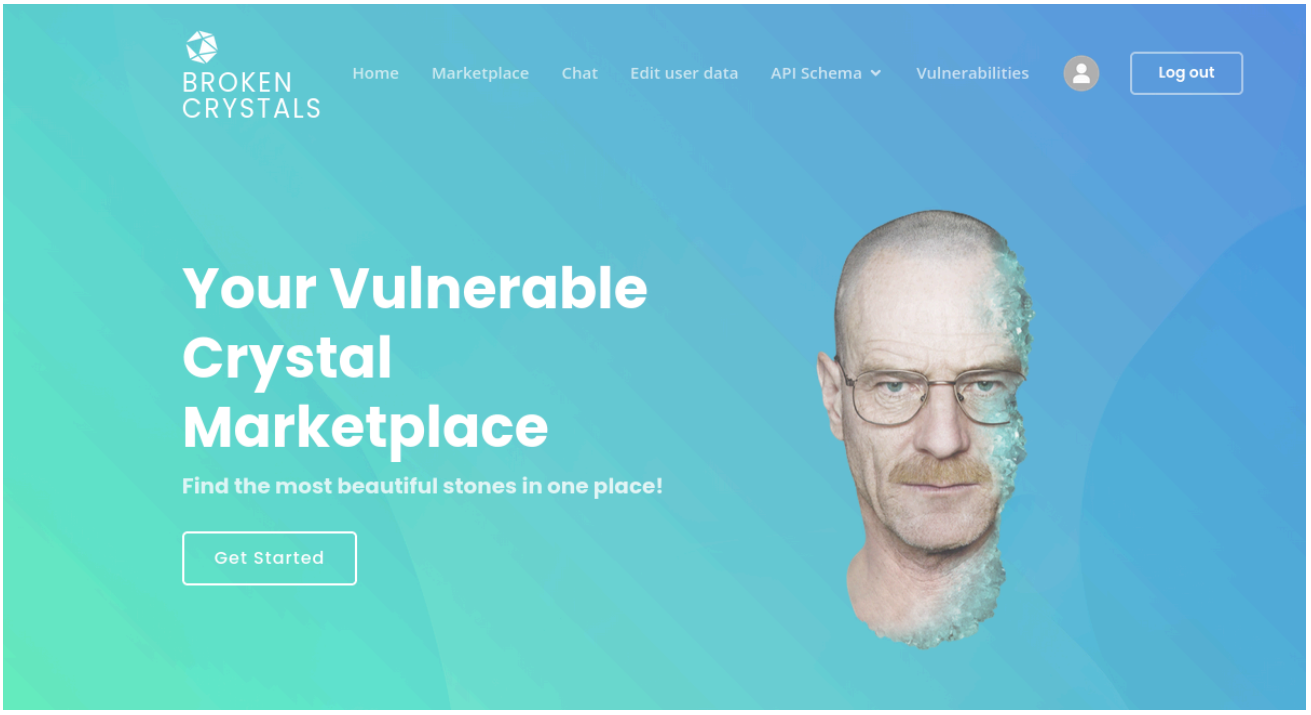
6. Use the discovered credentials to log in via the application's UI.





7. Successful authentication confirms full account compromise.
